KEY WORDS frustum · cone *(koeko)* · pyramid *(koeko tapawhā)* · similar triangles *(tapatoru rite)*

A The full cone ●●○

Remember: A frustum is a cone with its top cut off. The cut-off part is a smaller, similar cone. The cross-section shows two similar triangles: use them to find the full height H.

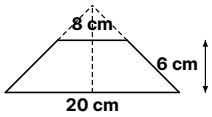

1. Each cross-section shows a frustum (solid lines) and the cut-off cone (dashed). The diameters and the height of the frustum are given. Find the full height H of the cone.

a)

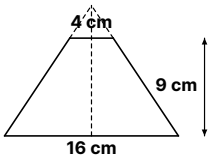

_____

b)

_____

c)

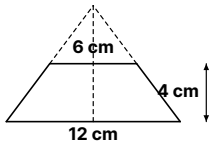

_____

B Volume of a frustum of a cone ●●●

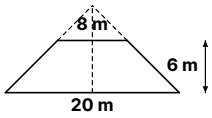

Remember: Volume of the frustum = volume of the full cone − volume of the cut-off cone. Find H first. Give answers to 1 decimal place.

2. Find the volume of each frustum.

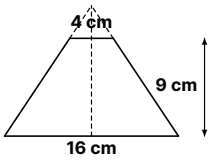

a)

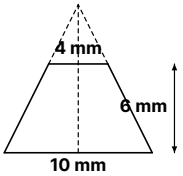

b)

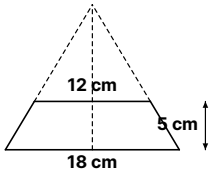

c)

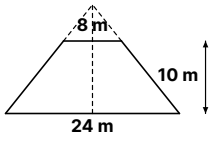

d)

e)

f)

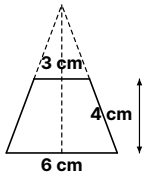

C Frustums of pyramids ●●●

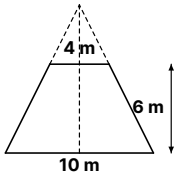

Remember: The same idea works for a pyramid: the cut-off top is a smaller, similar pyramid. Use the base edges instead of radii in the similar triangles.

3. Each solid is a square-based pyramid with its top cut off, shown in cross-section. Find its volume.

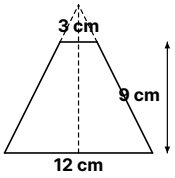

a)

b)

c)

D Problems ●●●

4. A bucket is a frustum of a cone: 14 cm radius at the top, 10 cm radius at the bottom and 25 cm high. How many litres does it hold, to 1 decimal place? (1 L = 1000 cm³.)

5. A plant pot is 15 cm tall with a top radius of 12 cm and a bottom radius of 8 cm. Find the volume of potting mix it holds, to the nearest cm³.

6. A lampshade is a frustum of a cone with a bottom diameter of 20 cm, a top diameter of 10 cm and a height of 24 cm. Explain how you would find the area of fabric needed for its curved surface, without working it out.

★ Extension

7. A frustum of a cone has radii 6 cm and 3 cm and a height of 4 cm. Its curved surface area is $\pi(R+r)s$, where s is the slant height of the frustum. Find the curved surface area, to 1 decimal place.

8. A frustum has radii R and r and height h. Show that its volume is $\frac{1}{3}\pi h(R^2+Rr+r^2)$.
